The Impact of Social Network

Prediction of Donations

Conclusions and Suggestions

- Crowdfunding typically contains three participating stakeholders:
 - **the project initiators**: seek funding for their projects
 - **the backers**: back a specific project
 - **the matchmaking crowdfunding platforms**: intermediaries
- Many researchers have discussed and studied the relationship between the three parts, their motivations, benefits, and risks
- Three different crowdfunding models:
 - **Commercial Crowdfunding**
 - **Poverty Alleviation Crowdfunding**
 - **Medical Crowfundings**

How Kickstarts Crowdfunding Platform works:

- (1) Its homepage includes Magic, Popular, Newest, Ending Soon.
- (2) For all projects, users can find a plan based on their interests from a lot of categories.
- (3) For a project, users can learn the creator's story and vision.
- (4) After learning the details of the project, users can donate to participate in this campaign.

How Social Poverty Alleviation-Love Charity Crowdfunding Platform works:

- (1) Its homepage includes: Love Support, Crowdfunding for Poverty Alleviation, Poverty Alleviation Exhibition and Poverty Alleviation Evaluation.
- (2) For poor households, users can input the title, target amount, detailed demand, and some attachments.
- (3) For poverty alleviation cadres, users can review the cases.
- (4) For caring users, people can help others.

农民工被老板上摩毒癌,请救...

父慈女孝,请救我半辈子...

(3)Information diffusion

(4)Love homepage

How Waterdrop Fundraising Platform works:

- (1) It includes a fundraiser uses an app to submit some essential information.
- (2) After authenticity review, the website will generate a case description detailed page.
- (3) In the process of information diffusion, people can spread fundraising information by sharing the message in WeChat Moment or WeChat groups.
- (4) Its love homepage will show some cases in process which may attract some caring people.

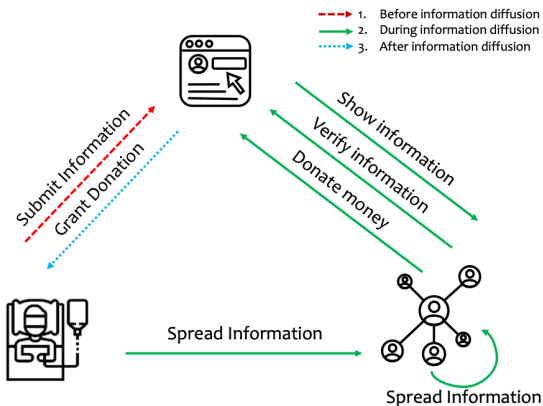

- Comparison for different crowdfunding models:

	Medical crowdfunding	Poverty alleviation crowdfunding	Commercial crowdfunding
Target	Healing disease	Poverty alleviation	Accomplishing plan
Time	In a short time	In a long time	In a longer time
Platform Organizer	Companies	Governments	Companies
Reward	No reward	No reward	Reward based on donations
Fundraiser	Patient	The poor	Organization/Individual
Fee	No fees	No fees	Some fees (e.g., 5%)
Risk	No risk	No risk	High risk
Utility of information diffusion	Important	General	General
Relationship with fundraiser	Close relationship	Strange relationship	Based on interest

Medical Crowdfunding Mechanism

Medical fundraising on the web can be divided into three phases:

- (i) Before the information diffusion, a fundraiser proposes a new case to the platform to conduct a preliminary review.
- (ii) During the information diffusion, users use their social networks to spread the crowdfunding information and call for donations. The platform collects verified information and donations from social networks.
- (iii) After the information diffusion, the platform grants the donations to the fundraiser.

Research Question

The Impact of Social Status

The Impact of Social Network

Prediction of Donations

Conclusions and Suggestions

- 1 What factors affect fundraising campaigns at different phases of **information diffusion**?
 - Before the information diffusion, what **social status factors** will affect the fundraising campaign?
 - During the information diffusion, what **social network factors** will affect the fundraising campaign?
- 2 Based on social status factors and social network factors, can we build a **predictive model that predicts future fundraising result in the early stages of information diffusion**?

Relationships between Verified Users and Fundraisers

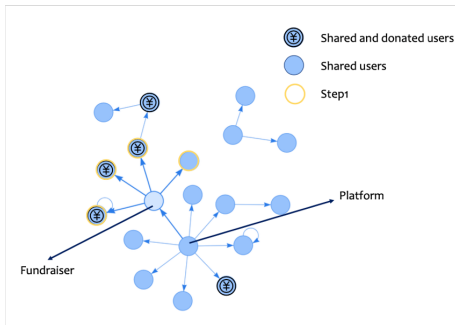

Verified Users Analysis

Social Utility of the Platform

- We define users who share the fundraising case from the fundraiser as the 'step1'. We define other users as 'other'.

- The proportion of donation in 'step1'(0.647) is significantly lower than 'other'(0.679), which $p\text{-Val} < 0.001$.
- But the average donation(101.9) is significantly higher than 'other'(60.5), which $p\text{-Val} < 0.001$.

Background

Dataset

Research Question

The Impact of Social Status

The Impact of Social Network

Prediction of Donations

Conclusions and Suggestions

- Machine learning methods on popularity prediction
 - Ex-ante prediction: only information available before a given cascade
 - Early prediction: the progression of a cascade for some time before making a prediction

Problem Definition

Prediction of donations in Waterdrop Fundraising

Prediction	Shared Counts			Donated Amounts		
	1 day	2 day	3 day	1 day	2 day	3 day
ANN($X_{content}$)		0.9289			0.9925	
SH(X_t)	0.1414	0.0694	0.0436	0.1254	0.0058	0.0338

ANN(X_t)	0.1246	0.0583	0.0383	0.1134	0.0493	0.0308
ANN($X_t + X_{content}$)	0.1218	0.0584	0.0388	0.1110	0.0489	0.0307

Background

Dataset

Research Question

The Impact of Social Status

The Impact of Social Network

Prediction of Donations

Conclusions and Suggestions

- Differences between different crowdfunding models.
- Most people can't finish their goals.
- For social status impact, we find that some **personal information** affect the fundraising campaign.
- For social network impact, we analyze the **utility of the platform, the social network verification mechanism, and the one-hop neighborhood.**
- Last but not least, we adopted some popularity prediction methods for **predicting the shared counts and donation.**

- For fundraisers:
 - We can guide the fundraisers to **describe their situation**.
 - They should ask more friends to **verify their cases and call for more sharing**.
- For platforms:
 - They can develop some **monitor systems** to make more early decision to promote the campaigns.
 - Their **social network verification mechanism** can be helpful for fundraising campaigns.
 - Besides, **the utility of the platform** is important for medical crowdfunding.
 - The platform should add **user privacy, user fairness, and social responsibilities** to the design of the platform.
